Tammer Rashdan

Web Development Self-Assessment

      Since the beginning of this course I feel that I've learned the necessary fundamentals and syntax of HTML, CSS, and JavaScript, in a way that allows for the three to be efficiently and cleanly integrated to produce a quality website. Despite being a bit tricky at times, seeing how to code a website in a practical sense in class is super helpful. I've taken some very basic web development classes before, but they never successfully managed to show how to code a website practically outside of simple exercises. As we move past the wireframes and into the visual designs this has been super helpful because not only can I make the interface but I can mentally try to visualize how to actually code it and use that knowledge to help with the design.

      I feel that this final project has been crucial in helping me learn all these concepts because it combines all these concepts of coding, UX design, and visual design in to a step-by-step understandable process so I can learn from experience as the project progresses. I'd say that although my process has not been excellent, that I am very happy with how the website is going so far, at least from the wireframe and visual design standpoint, and that those have come along very well.
